## Comprehensive Enterprise Migration to Exchange

Included as part of Netmail Archive, Netmail Migrate is the SAFE™ migration solution: it reduces the time and cost required to migrate users to Microsoft Exchange 2010 or 2013 on-premise or Online by archiving data to a central XML repository before the email migration even occurs. As a result, only a fraction of information needs to be moved to the new email system while all information remains available in platform-independent XML format. The use of the XML repository allows 100% transparent communications between the two email systems during the migration period; it is even possible to perform eDiscovery and litigation hold requests while migrating.

Netmail Migrate can slash an organization's migration budget by 70%

Netmail Migrate is included with Netmail Archive. This means that for approximately the same price as other third-party migration applications, Netmail Archive provides archiving and eDiscovery functionality and a full set of migration tools. And unlike single-use migration tools, a complete enterprise archiving system is in place at the end of the migration. Netmail Migrate provides additional functionality not available with other migration tools, including direct migration to Exchange 2010 or 2013 on premise or in the cloud without the need for legacy gateway systems, migration of personal address books, migration of future re-occurring calendar appointments, and migration of native archives without resorting to PST format.

Legacy Data Management and Email Retention

Leverages the advantages of lower cost storage and access flexibility of Netmail Archive which allows organizations to address the issues of legacy data management and email retention prior to migration so that email issues are not migrated along with the users.

Multiple Data Injection Options

Offers various options for injecting archived data into the Exchange system. Organizations can choose to inject all or some of the archived data into Exchange as is, as stubs, or with stripped attachments.

Automatic Provisioning of Users and Distribution Lists

Gives organizations the ability to automatically provision users and distribution lists to Exchange 2010 or 2013, including system address books, proxy rights, multiple email addresses, nicknames, and aliases, ensuring minimal impact on end users.

Support of Mixed Environments

Supports the deployment of mixed email environments to allow organizations to make the transition to Exchange 2010 or 2013 to suit their business and operational needs.

Seamless End-User Access to the Email

Provides your users with seamless access to their archived email due to its direct integration with Outlook and Outlook Web App.

Less IT Overhead

Allows a migration that is seamless to end users, thereby eliminating the need for IT to train and assist end users. IT simply needs to follow a few easy steps to archive and migrate information to Exchange 2010 or 2013.

Reduced Risk, Time, and Cost

Reduces the risk of data loss by archiving all information before migrating to Exchange 2010 or 2013 as well as reduces the time and cost associated with email platform migrations.

Regulatory Compliance

Addresses future challenges for archiving and regulatory compliance by offering sub-second search and retrieval of information via a standards-based, 100% compliant architecture.

Elimination of PST Files

Netmail PST Radar complements Netmail Migrate by allowing you to detect and locate PST files scattered across your organization's network. The PST files can then be archived to your central archive repository, along with the rest of your archived data, and the Exchange 2010 or 2013 PST feature can be disabled.

"We considered the Quest tool, but at the end of the migration, you just threw the tool away. You paid all that money just to migrate. With Netmail Migrate and Netmail Archive, we quickly realized that after the migration we were going to have an enterprise-level email archiving solution in place, and email archiving was definitely another project on our IT to-do list. What's more, the cost of the two products was comparable."
